

So it was funny because I tried to tell it that it was wrong when it was actually right and it would just give me another random answer that was even further than the first one which was funny. And I also tried giving it negative numbers and decimals, and it would not even recognize those as numbers so it would give me the error option answer, so this was also interesting. And when I tried giving more complicated long numbers it just would not even try to compute them and give me error message. So it was kind of a lazy bot I must say... It probably failed when I wasn't giving it positive and full numbers because it probably just didn't recognize those tokens and was expecting full numbers tokens only , and I see there was also a limitation in how big the numbers could go, But I think If I had given it more instructions and more options for tokens it could have potentially solved those problems. It was really long to load when I tried inputting slightly bigger numbers as well, which was annoying and long because it would have been faster for me to type it myself on the calc, which would make the bot totally useless. But I have to say it wasn't as bad as I thought, the basic numbers he could do pretty fast and it was accurate.
